

# *Ovation* is *the* free DeskTop Publisher for **RISC OS**.

*Ovation* is a complete publishing package that is easy to learn and use. If you are looking for a friendly word processor, look no further. Automatic headers and footers are available if you require them.

However, to really unleash the power of *Ovation*, you need to understand that **frames are rectangles**. You can position these rectangles **pretty much anywhere**, including **inside** other rectangles. Inside all these rectangles? That's where you can put **text**. Or **pictures**. From these simple building blocks, you can go from simply making letters to friends more expressive, to newsletters, to mailshots, to whatever takes your fancy.

It doesn't end there. *Ovation* offers a range of typographic effects along with user defined paragraph styles, and enhanced features such as *leading*. Rulers, double page support, adjustable tabs (including within frames), stylesheets, autosave, and a sixty thousand word spellcheck dictionary round off the package.

Combined with the RISC OS PostScript driver, and Stephen Fryatt's "PrintPDF" front-end for GhostScript, it is simple to "print" your documents as PDFs.

What more need I say? Download *Ovation* **right now** and get creative!
